Agenda

- 01 New Relic APM overview
- 02 Lab: Explore the service summary page
- 03 Lab: Troubleshooting a performance problem
- 04 Lab: Using Logs

Lab: Explore the APM service summary page

The *Service Summary* page in APM is a set of curated charts to help you diagnose issues and follow links to delve deeper into related metrics, and troubleshoot the problem. Explore this page for a service and answer the questions below:

1. How can you change the time range displayed on the charts?
2. How can you learn what each chart means?
3. How can you see where the application is spending the most time?
4. How can you view the slowest transactions?
5. How can you see other services related to this one?
6. How you investigate errors?

Lab: Troubleshoot an APM performance issue

Find the **Ad Service** in the **Demogorgon Prod** account. Set the time window to the past 60 minutes. Notice that there are several response-time spikes in the past hour.

Follow the steps at

<https://docs.newrelic.com/docs/tutorial-improve-app-performance/root-causes/#identify> to investigate the response-time spikes.

Lab: Explore Logs

1. Select the **Demogorgon Prod** account. From New Relic's main menu, select *Logs*
2. How can you see logs from the past 6 hours?
3. Filter the list to show only logs with a level of ERROR. How many logs are there?
4. Add a column to the results table to display the log level and entity.name of each log
5. How can you change your filter query to show only logs that contain a value for entity.name?
6. How could you save this view to quickly recall it later?
7. Click on a log entry and see its attributes. How can you easily share the details of a log entry with your team? What if they don't have access to your New Relic account?
