

Boost Performance and Reliability Engineering with Dashboard Visualisation Techniques

New Relic Certification alignment

After completing this online workshop you will receive a **50% discount PROMO code via email** to use on any Associate- or Professional-level New Relic certification.
(Terms and conditions will be provided with the promo code and email)

New Relic Certified APM Practitioner - Associate (APA)

[Online Workshop] Boost performance & reliability engineering with dashboard visualisation techniques

Monitor, analyze, troubleshoot, and improve the performance of modern applications & distributed architectures using APM and related data sets.

New Relic Certified APM Practitioner - Associate (APA) is for anyone with at least six months of experience in performance analysis using New Relic application performance monitoring.

This workshop contains content that aligns to the following exam sections highlighted in pink

Exam Guide

Section 1: New Relic Fundamentals Focuses on foundational knowledge, benefits and core features of APM	10%
Section 2: Managing Agent Data Focuses on instrumenting applications using APM agents, setting up application names, configuration settings, and tagging	20%
Section 3: Visualising Insights Explores the tools and strategies for visualising and understanding APM data	30%
Section 4: Full Stack Observability Practices with APM Focuses on troubleshooting performance using New Relic APM. Addresses monitoring and management of applications and databases. Uses integrated data sets such as logs, traces, and infrastructure metrics; and shows how to set up alerts and manage notifications	40%

New Relic Certified Performance Engineer - Professional (PEP)

[Online Workshop] Boost performance & reliability engineering with dashboard visualisation techniques

Analyze and optimize systems and applications using a broad range of New Relic monitoring and performance management tools, with a focus on exceptional user experience.

The Performance Engineer - Professional (PEP) is for professionals who have 2 or more years of experience in performance analysis and optimization using New Relic monitoring and performance management tools.

This workshop contains content that aligns to the following exam sections highlighted in pink

Exam Guide

Section 1 New Relic Platform Capabilities and Data 30%
This section focuses on the fundamental capabilities of the New Relic Platform, including performance monitoring, error management, alerting, data visualisation, and log management.

Section 2 Backend Application Performance 30%
This section delves into the monitoring and optimization of server-side applications, covering aspects like APM setup, microservices, and database performance.

Section 3 Client-side Performance 20%
This section concentrates on evaluating and improving the performance of frontend applications, using browser and mobile monitoring tools as well as synthetic testing.

Section 4 Infrastructure and Cloud Performance 20%
This section addresses the monitoring and management of server and cloud infrastructure, including cloud service integrations, container metrics, and database infrastructure.

New Relic Certified Reliability Engineer - Professional (REP)

[Online Workshop] Boost performance & reliability engineering with dashboard visualisation techniques

Analyze and optimize systems and applications using a broad range of New Relic monitoring and performance management tools, with a focus on exceptional user experience.

The Performance Engineer - Professional (PEP) is for professionals who have 2 or more years of experience in performance analysis and optimization using New Relic monitoring and performance management tools.

This workshop contains content that aligns to the following exam sections highlighted in pink

Exam Guide

Section 1: Alerts and Incident Management 25%
New Relic alert concepts. Custom alert policies, conditions Notification channels and incident workflows. Alert quality management (noise reduction). Incident post-mortem and root cause analysis (RCA)

Section 2: Service Level Management 25%
Managing service levels in New Relic. Understanding SLIs, SLOs, and service level attainment. Service boundaries and prioritizing SLO

Section 3: Infrastructure, Cloud Integration, and Networking 30%
Vulnerability management and containerised (Docker and K8s) workloads. Serverless workloads. On-host integrations and common cloud integrations. Advanced tuning of infrastructure agent. With network monitoring correlate and analyze application to reduce MTTR

Section 4: Automation 20%
Create observability fixtures using New Relic APIs & Terraform

Agenda

- 01 Data types and Data Explorer
- 02 NRQL
- 03 Dashboard fundamentals
- 04 Chart types
- 05 Advanced dashboard techniques

© 2025 New Relic, Inc. All rights reserved

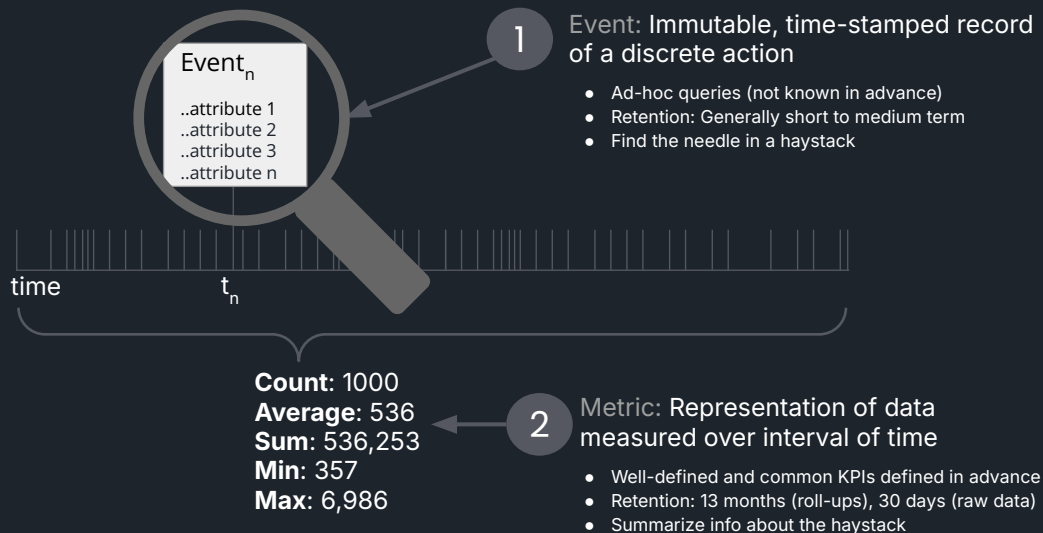

The New Relic Platform

© 2025 New Relic, Inc. All rights reserved

Metrics vs. Events

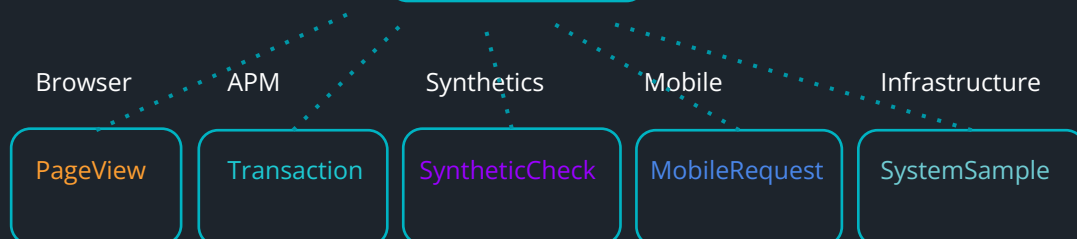

© 2025 New Relic, Inc. All rights reserved

new relic

Common event types

`SELECT function(attribute) FROM EventType WHERE condition FACET group by`

```
SELECT count(*) FROM PageView FACET PageUrl SINCE 1 day ago
```

10

new relic

Lab: Data Explorer

1

Build these queries by selecting the following options:

- Event type: **Transaction** > **Count**, **name** > **FACET**
This shows throughput for different Transactions
- Event type: **Transaction** > **Count**, **appName** > **FACET**
This shows throughput for different Applications
 - Try a different chart type (Bar chart, Pie chart, etc.)
- Event type: **Transaction**, **duration** > **max**, **name** > **FACET**
This shows slowest Transactions
- Event type: **PageView**, **duration** > **max**, **pageUrl** > **FACET**
This shows slowest Pages. Try a Bar chart and filter to a pageUrl by clicking one from below

2

Try **PageView** > **Raw data** and explore the attributes of the PageView event type

12

NRQL syntax

SELECT ... FROM

SELECT function(attribute) **FROM** EventType **WHERE** condition **FACET** group by

```
SELECT count(*) FROM Transaction WHERE appName = 'Frontend' FACET name
FROM Transaction SELECT count(*) WHERE appName = 'Frontend' FACET name
```

Lab: Explore your data

Try these queries

Select Query Your Data

1

`SHOW EVENT TYPES`

Which event types are reporting?

2

`SELECT keyset() FROM Transaction`

Explore the attributes. Do you think any of them are custom / business attributes?

3

`SELECT count(*) FROM Transaction`

Aggregate the data to retrieve a single value

4

`SELECT count(*) FROM Transaction FACET appName`

Select DISTINCT values (GROUP BY) using FACET

Look up default event types and attributes in the [New Relic data dictionary](#)

NOTE: You can't FACET until you aggregate

`SELECT * FROM``SELECT count(*)`
